### REASONS FOR ALLOWANCE

1. The following is an examiner's statement of reasons for allowance:

The invention as claimed is a series combination of two techniques: (A) the technique of allowing the operator to select a setting for linefeed error based on a series of test patterns, and (B) the technique(s) of modifying a parameter setting to respond to component wear or to print media characteristics. Even if both A and B are considered known in the prior art, no suggestion was found to combine them in series, *ie*, given A, no suggestion was found in the prior art so that a person of ordinary skill in the art would be motivated to add B in series with A.

Nor does the examiner consider that a person of ordinary skill in the art, starting with a printer that already incorporates A and motivated as a routine design decision to add feature B in order to reap the known benefits of correcting for component wear and/or print media characteristics, would arrive at the invention without the benefit of hindsight. The series combination of A and B, as done in the invention, is more than merely combining B with A: the invention allows A to influence B since B actually uses as the value upon which to base its calculations the "normal value" selected by the operator in A. Even if both A and B are considered known, then this interconnection between A and B is not taught in the prior art.

That is to say, the combination of A in series with B additionally provides a marriage of the two techniques so as to produce a feature not found in the prior art: whenever the operator performs technique A then at least one input parameter for technique B is modified. The prior art

Art Unit: 2723

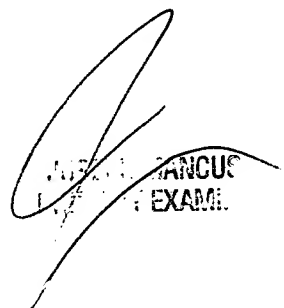

does not seem to have the feature of allowing the operator to arbitrarily modify the preset programs for correcting for component wear and/or print media characteristics.

The closest suggestion found was US Patent 5,439,302 to Andou *et al*, which, based on periodic automatic self tests, updates the adjustment value for a printer parameter (exciting current pulses for a dot impact printer) stored in non volatile memory. The invention differs in that it concerns an entirely different parameter and in that it revises the value stored in memory due to an operator-initiated test and an operator-selected result rather than an automatic periodic self test procedure update. The combination in the invention does not update a parameter using a closed loop feedback system such as demonstrated by Andou.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
